

IN THE CLAIMS

This listing of claims will replace all prior versions, and listings, of claims in the application:

Listing of Claims:

1. (Previously Presented) An electronic device, comprising:
a first wireless transceiver module using a first communication protocol;

a second wireless transceiver module using a second communication protocol, the second wireless transceiver module comprising a controller for avoiding an interference with an external signal on a frequency of the second communication protocol; and

a mediator coupled between the first wireless transceiver module and the second wireless transceiver module, the mediator being arranged to provide the controller with a blocking signal to block the second wireless transceiver module in response to an enabled communication involving the first wireless transceiver

module.

2.(Previously Presented) The electronic device as claimed in claim 1, wherein the controller implements at least a part of a carrier sense multiple access-collision avoidance principle.

3.(Previously Presented) The electronic device as claimed in claim 1, wherein the first wireless transceiver module and the second wireless transceiver module share at least a part of a physical layer.

4.(Previously Presented) The electronic device as claimed in claim 1, wherein the mediator is arranged to provide the blocking signal during a time interval matching the duration of the enabled communication.

5.(Previously Presented) The electronic device, as claimed in claim 1, wherein the first wireless transceiver module comprises a further controller for avoiding an interference with a further

external signal on a frequency of the first communication protocol;
the mediator being further arranged to provide the further controller with a further blocking signal in response to a further enabled communication involving the second wireless transceiver module.

6. (Original) A method for controlling communications involving a communication system, the communication system comprising:

a first wireless transceiver module using a first communication protocol;

a second wireless transceiver module using a second communication protocol, the second wireless transceiver module comprising a controller for avoiding an interference with an external signal on a frequency of the second communication protocol;

the method comprising the acts of:

detecting an enabled communication involving the first wireless transceiver module; and

providing the controller with a blocking signal to block the second wireless transceiver module in response to the enabled communication.

7. (Previously Presented) A communication system, comprising:

a wired network;

a first wireless transceiver module coupled to the wired network using a first communication protocol for communicating with a first external device;

a second wireless transceiver module coupled to the wired network using a second communication protocol for communicating with a second external device, the second wireless transceiver module comprising a controller for avoiding an interference with an external signal on a frequency of the second communication protocol; and

a mediator coupled to the first wireless transceiver module and the second wireless transceiver module for providing the controller with a blocking signal to block the second wireless transceiver module in response to an enabled communication

involving the first wireless transceiver module.

8. (Previously Presented) The communication system as claimed in claim 7, wherein the mediator is coupled to the controller via the wired network.

9. (Previously Presented) The communication system as claimed in claim 7, wherein the first wireless transceiver module comprises a further controller for avoiding an interference with a further external signal on a frequency of the first communication protocol; and

the mediator is arranged to provide the further controller with a further blocking signal responsive to a further enabled communication involving the second wireless transceiver module.

10. (Previously Presented) The communication system as claimed in claim 7, wherein the first transceiver module and the second transceiver module share at least a part of a physical layer.

11. (Currently Amended) ~~The electronic device of claim 1, An~~
electronic device, comprising:

a first wireless transceiver module using a first
communication protocol;

a second wireless transceiver module using a second
communication protocol, the second wireless transceiver module
comprising a controller for avoiding an interference with an
external signal on a frequency of the second communication
protocol; and

a mediator coupled between the first wireless transceiver
module and the second wireless transceiver module, the mediator
being arranged to provide the controller with a blocking signal to
block the second wireless transceiver module in response to an
enabled communication involving the first wireless transceiver
module;

wherein the mediator is configured to observe commands from
the first wireless transceiver module to a physical layer.

12. (Previously Presented) The electronic device of claim 1,

wherein the mediator is coupled to a communication channel between the first wireless transceiver module and a physical layer.

13. (Previously Presented) The electronic device of claim 12, wherein the physical layer is shared between the first wireless transceiver module and the second wireless transceiver module.

14. (Currently Amended) ~~The electronic device of claim 1, An~~
electronic device, comprising:

a first wireless transceiver module using a first
communication protocol;

a second wireless transceiver module using a second
communication protocol, the second wireless transceiver module
comprising a controller for avoiding an interference with an
external signal on a frequency of the second communication
protocol; and

a mediator coupled between the first wireless transceiver
module and the second wireless transceiver module, the mediator
being arranged to provide the controller with a blocking signal to

block the second wireless transceiver module in response to an enabled communication involving the first wireless transceiver module;

wherein the blocking signal is fed into a received signal strength indication channel of the controller.

15. (Previously Presented) The electronic device of claim 14, wherein the blocking signal has a signal strength exceeding a threshold of a collision avoidance protocol of the second wireless transceiver module.

16. (Currently Amended) ~~The method of claim 6,~~ A method for controlling communications involving a communication system, the communication system comprising:

a first wireless transceiver module using a first communication protocol;

a second wireless transceiver module using a second communication protocol, the second wireless transceiver module comprising a controller for avoiding an interference with an

external signal on a frequency of the second communication
protocol;

the method comprising the acts of:

detecting an enabled communication involving the first
wireless transceiver module; and

providing the controller with a blocking signal to block the
second wireless transceiver module in response to the enabled
communication;

wherein the detecting step-act includes observing commands
from the first wireless transceiver module to a physical layer.

17. (Previously Presented) The method of claim 16, wherein the
physical layer is shared between the first wireless transceiver
module and the second wireless transceiver module.

18. (Currently Amended) ~~The method of claim 6,~~ A method for
controlling communications involving a communication system, the
communication system comprising:

a first wireless transceiver module using a first

communication protocol;

a second wireless transceiver module using a second communication protocol, the second wireless transceiver module comprising a controller for avoiding an interference with an external signal on a frequency of the second communication protocol;

the method comprising the acts of:

detecting an enabled communication involving the first wireless transceiver module; and

providing the controller with a blocking signal to block the second wireless transceiver module in response to the enabled communication;

wherein the providing ~~step~~-act includes feeding the blocking signal into a received signal strength indication channel of the controller.

19. (Previously Presented) The method of claim 18, wherein the blocking signal has a signal strength exceeding a threshold of a collision avoidance protocol of the second wireless transceiver

module.

20. (Currently Amended) ~~The communication system of claim 7, A~~
communication system, comprising:

a wired network;

a first wireless transceiver module coupled to the wired
network using a first communication protocol for communicating with
a first external device;

a second wireless transceiver module coupled to the wired
network using a second communication protocol for communicating
with a second external device, the second wireless transceiver
module comprising a controller for avoiding an interference with an
external signal on a frequency of the second communication
protocol; and

a mediator coupled to the first wireless transceiver module
and the second wireless transceiver module for providing the
controller with a blocking signal to block the second wireless
transceiver module in response to an enabled communication
involving the first wireless transceiver module;

wherein the mediator is configured to observe commands from the first wireless transceiver module to a physical layer.

21. (Previously Presented) The communication system of claim 7, wherein the mediator is coupled to a communication channel between the first wireless transceiver module and a physical layer.

22. (Previously Presented) The communication system of claim 21, wherein the physical layer is shared between the first wireless transceiver module and the second wireless transceiver module.

23. (Currently Amended) ~~The communication system of claim 7, a~~
communication system, comprising:

a wired network;

a first wireless transceiver module coupled to the wired network using a first communication protocol for communicating with a first external device;

a second wireless transceiver module coupled to the wired network using a second communication protocol for communicating

with a second external device, the second wireless transceiver module comprising a controller for avoiding an interference with an external signal on a frequency of the second communication protocol; and

a mediator coupled to the first wireless transceiver module and the second wireless transceiver module for providing the controller with a blocking signal to block the second wireless transceiver module in response to an enabled communication involving the first wireless transceiver module;

wherein the blocking signal is fed into a received signal strength indication channel of the controller.

24. (Previously Presented) The communication system of claim 23, wherein the blocking signal has a signal strength exceeding a threshold of a collision avoidance protocol of the second wireless transceiver module.
